

Creators can't borrow against income **they** **can't** prove.

IPLink makes it provable — verified royalty financing built on Creditcoin and the Attestcoin Protocol.

Live on testnet

BUIDL CTC 2026 · RWA track

The income is real. Proving it isn't.

A musician earning \$2,000 a month from her catalog has genuinely earned it. But a bank can't audit Spotify's payout ledger, and an on-chain lender can't read a distributor's database. So the income sits there — recurring, real, and unusable as collateral.

\$323B

Creator economy, 2026 — up 26.5% year over year

207M

People worldwide who identify as creators

50%+

Earn under \$15,000 a year — and can't finance any of it

Every workaround puts someone back in the middle.

Verification has fixed costs. Those costs don't scale down — which is why underwriting has a floor, and why everything below it goes unfunded.

APPROACH ONE

Platform dashboards

A screenshot of earnings is a claim, not evidence. It can be edited, staged, or simply wrong — and no lender will underwrite against it.

APPROACH TWO

API integrations

Better, but you're trusting that the endpoint is genuine and unspoofed. Each new platform is another bespoke integration to build and maintain.

APPROACH THREE

Oracle operators

An operator asserting "this payment happened" is precisely the single point of trust that on-chain finance exists to remove.

The capital exists. It just has a floor.

Institutional money has already decided royalty income is a real asset class. Publishers pay 18–26× annual revenue for verified catalogs. Blackstone committed over \$1.2B between 2021 and 2025.

But financing platforms want roughly **\$25,000 a year** in royalties before they'll look at you. Below that line, verifying the income costs more than the deal is worth.

That floor is a verification problem, not a risk problem.

\$8.2B

Music catalog finance market in 2025, heading to \$17.8B by 2034

\$40.4B

Music royalty market, 2026

18–26×

Annual revenue multiples paid for verified catalogs

Any IP that earns can be financed.

Creators raise capital against revenue that has been cryptographically proven on-chain. They keep the asset — they're selling a share of future income for a defined period, not the IP itself.

FOR CREATORS

Capital without selling

No credit check, no collateral, no institution deciding whether your work counts.

FOR INVESTORS

Income you can check

Every figure traces to a transaction proven on-chain. Nothing is self-reported.

Nothing moves until it's proven.

Each step has to actually happen, on-chain, before the next one can run. There is no intermediate state anyone has to trust.

01

Payment lands

Revenue arrives on the source chain — a distributor pays out, a marketplace settles.

Ethereum Sepolia

02

Proof generated

Attestcoin produces a Merkle inclusion proof that this exact transaction was in a real block.

Attestcoin Protocol

03

Verified on-chain

Creditcoin's Block Prover precompile checks the proof natively, in about one block.

BlockProver · 0x0FD2

04

Payout unlocks

Only now is revenue recorded, the investor share calculated, and the payout made claimable.

RevenueVerified

The thesis already matched.

Creditcoin exists to make credit history verifiable on-chain — so that a proven track record can do the job collateral usually does. It was built for borrowers no institution could underwrite.

That is exactly the creator's problem, in a different asset class. We didn't choose Creditcoin because it was available. We chose it because the problem was the same one.

The attested credit record

Every verified payment becomes a permanent, unfakeable entry in that creator's history. Aggregated across campaigns, it forms a portable track record an investor can check before funding the next raise.

Structurally the same primitive as loan-repayment history — applied to royalties.

Not a bridge. Not an oracle.

Three approaches could connect off-chain revenue to on-chain financing. Only one avoids reintroducing a middleman.

REJECTED

A token bridge

Bridges move assets between chains. IPLink doesn't need to move anything — it needs to prove a fact occurred. Right tool, wrong problem.

REJECTED

A centralized oracle

An operator reporting "this payment happened" reintroduces the exact single point of trust that verification is meant to remove.

CHOSEN

Attestcoin Protocol

Proves transaction inclusion using Merkle and continuity proofs, verified natively on Creditcoin in roughly one block. No operator, no async wait, no trust assumption.

Verification and business logic in one transaction.

- **No access control on `execute()`**
Anyone can submit a proof — creator, investor, or a stranger. Trust comes from the proof, not the submitter.
- **Inherits Creditcoin's `USCBase`**
Replay protection by query ID, then native precompile verification, before any business logic runs.
- **Decoded with `EvmV1Decoder`**
Receipt status, emitting contract, campaign binding and creator identity are all checked on-chain.
- **Proofs bind to one campaign**
The event carries the campaign address, so a single payment can never be counted twice.

NOT A MOCKUP

Deployed, running, and checkable.

Every contract below is live on public testnets. Every transaction in our demo is on a public explorer.

[iplink-cyan.vercel.app](#) · [github.com/Kingnanaweb3/iplink](#)

We audited ourselves and published the results.

Ten issues found, several severe. All fixed in the deployed contracts, each with a test in the repository.

- ✓ Share token transfer drain — shares made non-transferable
- ✓ Capital release over-withdrawal — fixed amount, once only
- ✓ Cross-campaign proof replay — proofs bound to one campaign
- ✓ Double-investment erasing earnings — settle before rebalance
- ✓ Missing refunds, false completion, bricking, self-investment, dust

Plus a **40% reserve** held in every campaign so investor payouts don't depend on a creator depositing funds later.

Creator abandonment is bounded, not solved

A creator can take their 60% and never verify revenue. Investors recover at most the reserve. No contract can compel someone to earn money.

Verification proves payment, not legitimacy

A proof confirms a transaction happened — not that it came from genuine royalties. Production requires registering a distributor's real payout contract at onboarding.

The marketplace is the demo. The record is the primitive.

SHIPPED

Trustless verification, end to end

Real payments, real proofs, real on-chain verification, real payouts — live on public testnets.

NEXT

Distributor integrations

Point at a distributor's actual payout contract instead of a stand-in — the honest fix for revenue legitimacy.

NEXT

More source chains

Every chain Attestcoin adds unlocks another revenue category. The contracts already work; the bottleneck is coverage.

THE THESIS

Attested income history as shared infrastructure

A portable, verified track record that any lending protocol on Creditcoin could underwrite against — not just IPLink.
